Tuff Game:

```
Description:
Tuff Game
50
Swif7Bl8ze

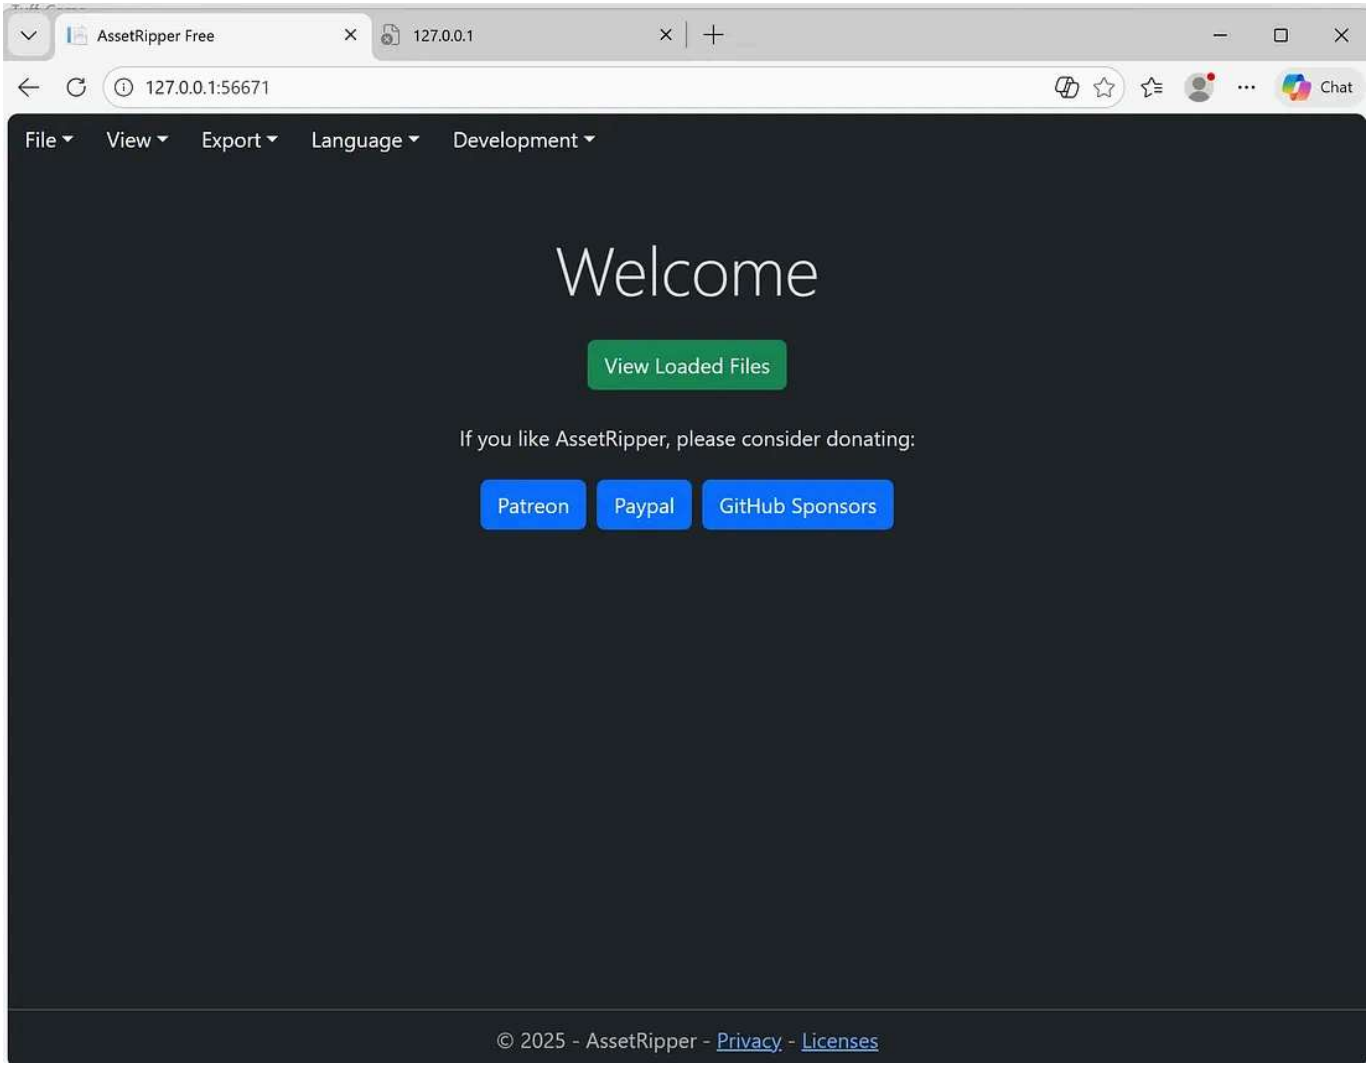
My friend Kekwman has challenged me to defeat this game,
reach a million metres and help me defeat his score
```

Tuff Game is a unity engine build game using mono scripting which means its easier to extract the C# code.

Tool

AssetRipper

This tools extract the unity project as a whole with all Texture and Codes from Assembly_CSharp.dll



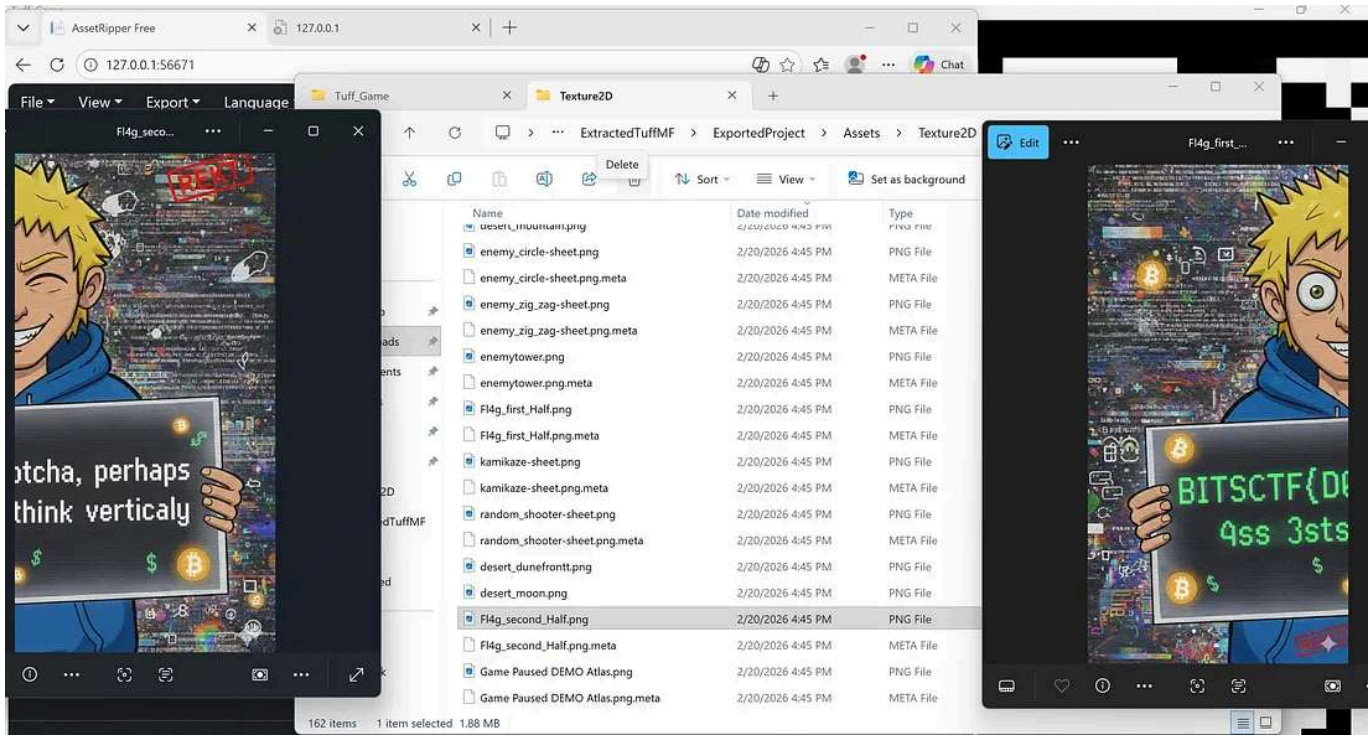
We can load our Tuff Game Folder and extract it using the tool.

This extracts Texture2D, Scripts, Resources, etc.

Inside of the Extracted Games files folder

```
Go to Extracted folder
Go to Texture2D # this stores all the images
```

```
We see 2 flag files
```



We get a hint saying

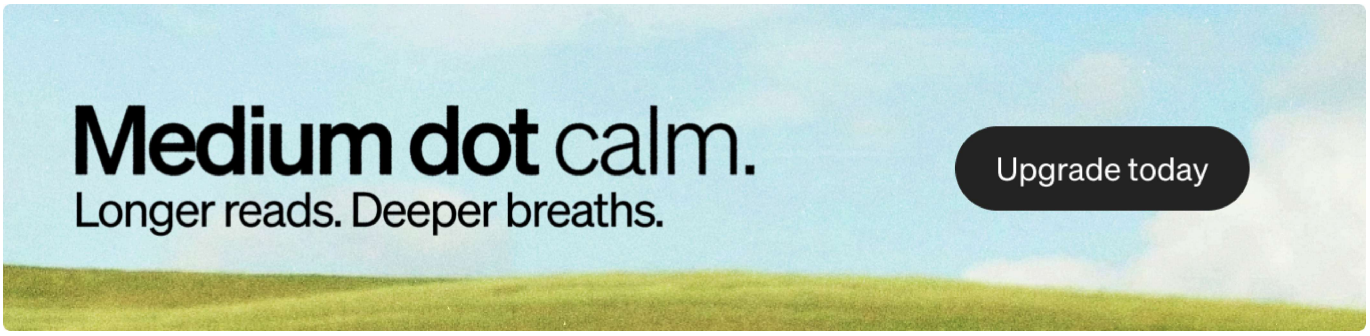
```
Perhaps go vertically
```

If we look at the description, its says score 1 million. Inside Unity 2d game we have 2 axis which is (x,y), x is right and left and y is up and down. Meaning vertically means we need to go up.

Tool

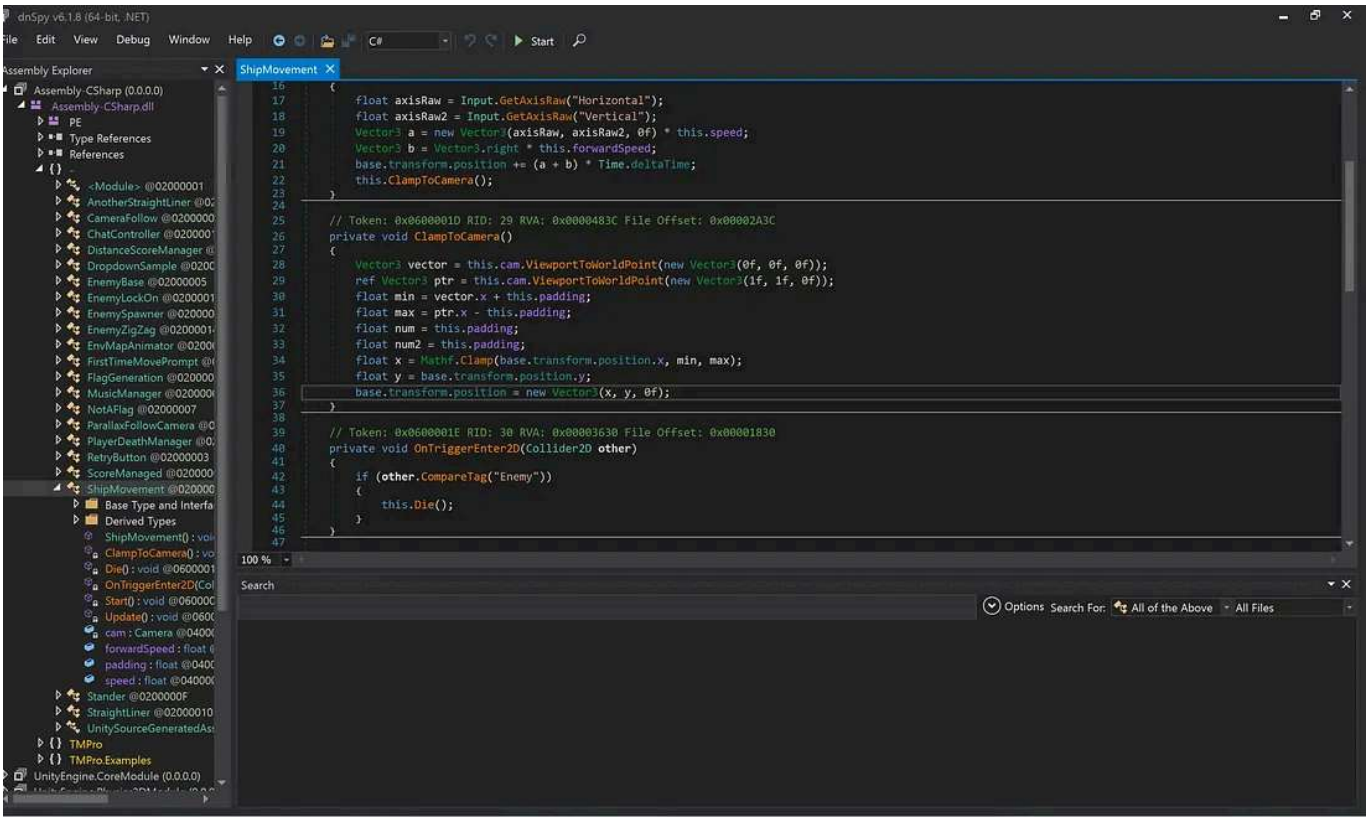
dnSpy

This tool allow us to modify the Assembly_CSharp.dll file which stores all our scripts for the game. We can change the code of the game using the tool.

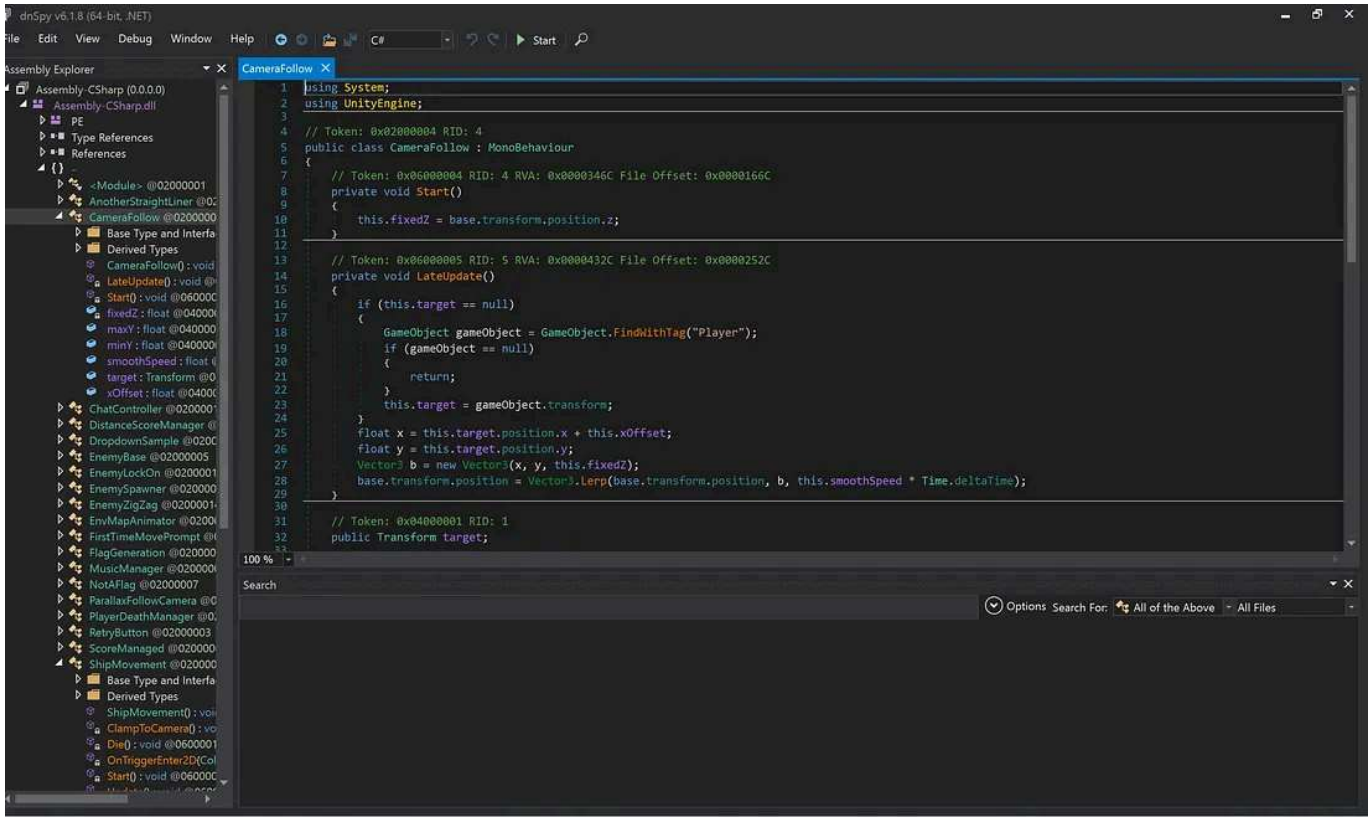


Our task is to go vertically up about 1 million meters. We have to change these codes.

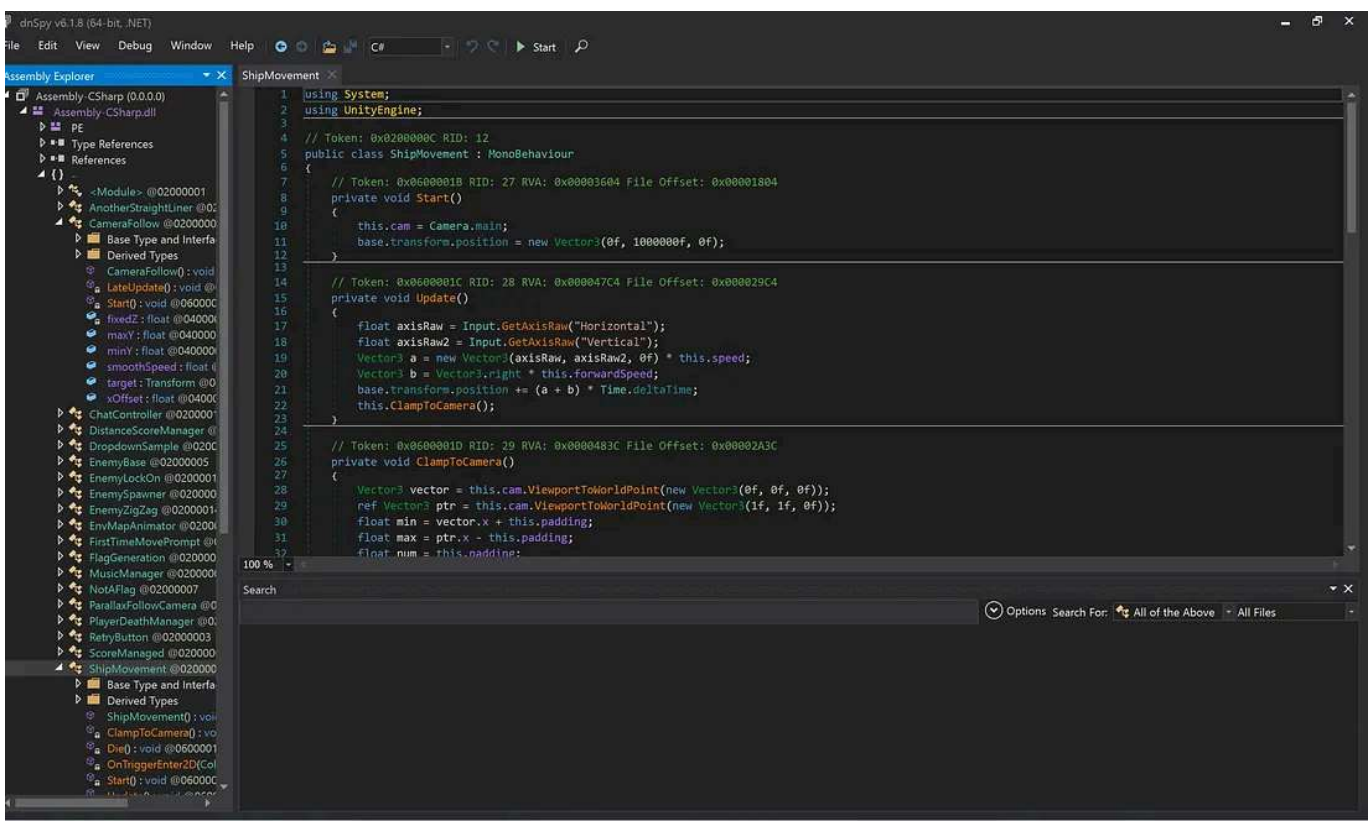
Firstly we remove the boundary set to our player ship, letting player go anywhere in the 2d tiles.



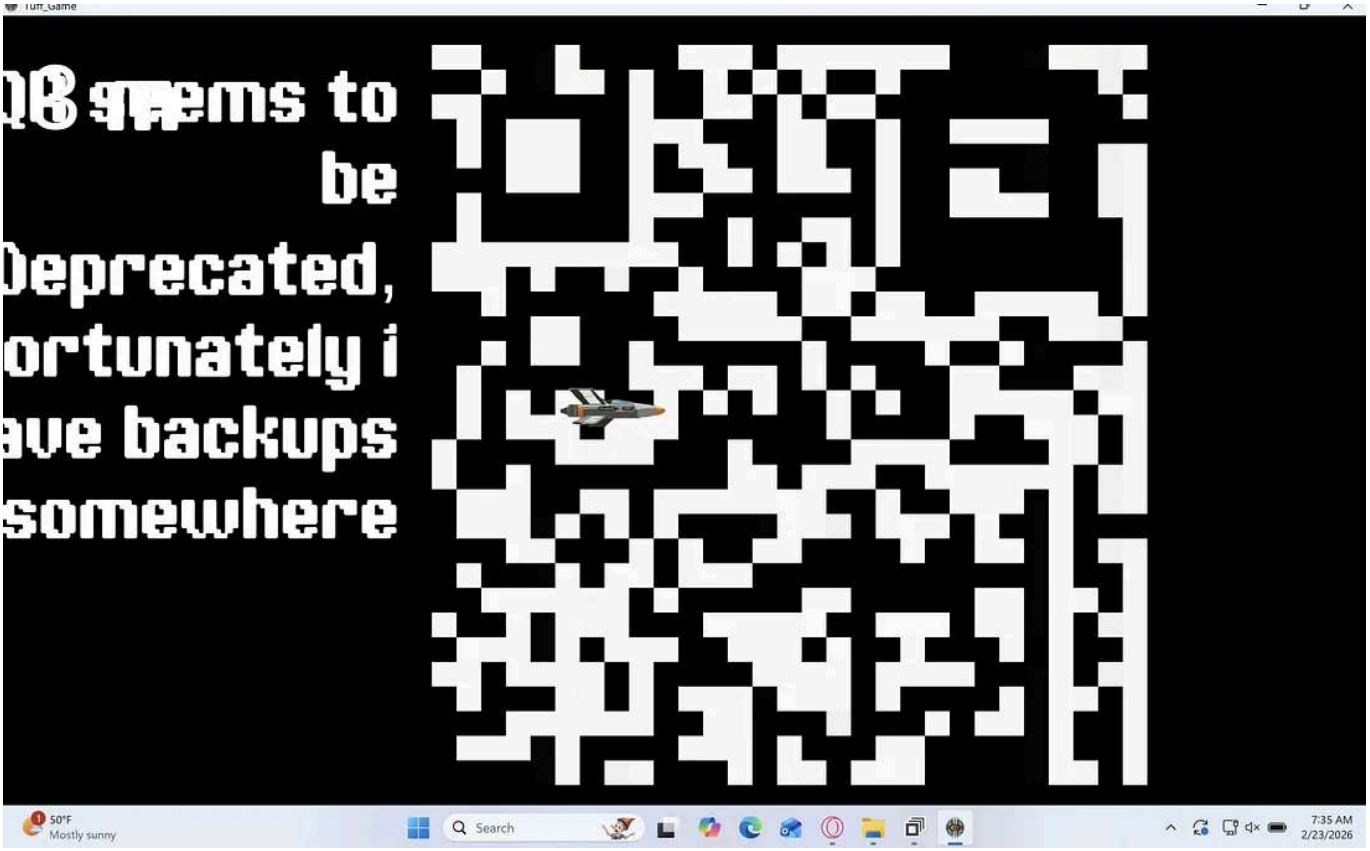
Second we make the camera follow the player outside of the set bounds.



Third make the player directly spawn at y axis 1 million meters using the Start method.



Now, lets start the game!!

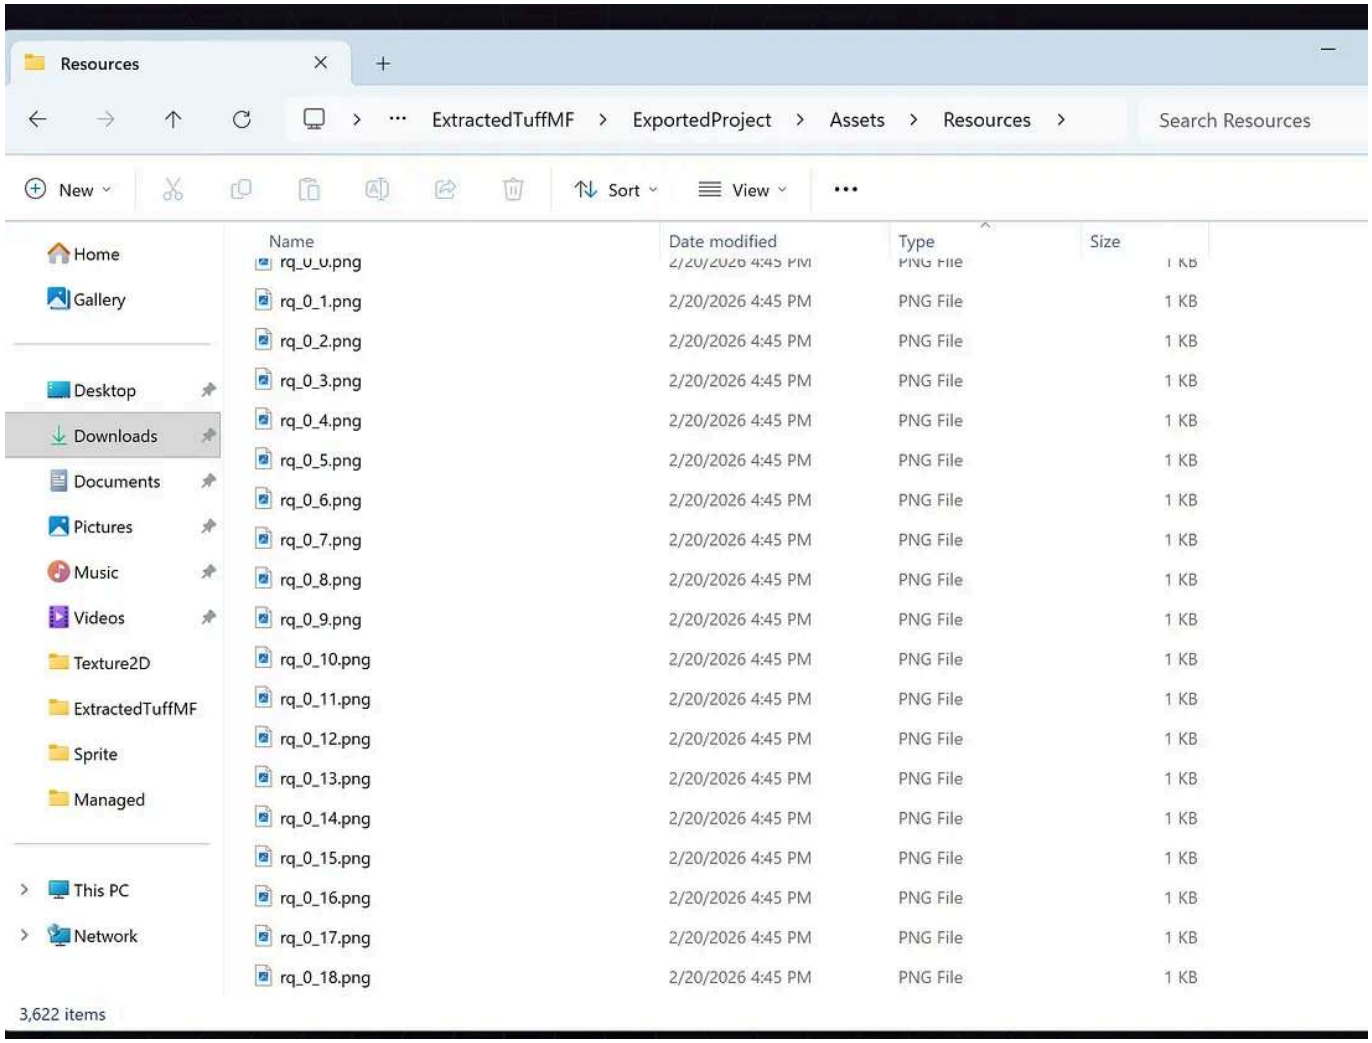


Taddaaa, we seem to get a demangled QR.

```
New hint hmm
QR seems to be Deprecated, fortunately i have backups somewhere
```

Lets go back to the extracted files.

Inside the Resources Folder we can se rq...png files, hmm, rq looks like QR also the images are in small pieces.



We can use python script to reconstruct the image...

```
from PIL import Image
import os

FOLDER = "RQ"
GRID_SIZE = 30   # rq_0_0.png → rq_29_29.png

sample = Image.open(os.path.join(FOLDER, "rq_0_0.png"))
tile_w, tile_h = sample.size

qr_img = Image.new(
    "RGB",
    (tile_w * GRID_SIZE, tile_h * GRID_SIZE)
)

for y in range(GRID_SIZE):
    for x in range(GRID_SIZE):
```

```
            tile_path = os.path.join(FOLDER, f"rq_{y}_{x}.png")
            tile = Image.open(tile_path)
            qr_img.paste(tile, (x * tile_w, y * tile_h))

    qr_img.save("reconstructed_qr.png")
```
